The ligand identified by the method of the invention is useful for the development of novel medicines and medicinal diagnostics. The present sequence represents hydrophobic protein mellitin-flag @Tag-human m1 mAChR-EE used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method for identifying a ligand for hydrophobic protein. The method comprises selecting a ligand molecule affinity selection by exposing a hydrophobic target protein bound by amphiphile to a multiplicity of molecules to promote formation of at least a complex between the hydrophobic target protein and the ligand molecule, separating the complex from the unbound molecules, and identifying the ligand molecule. The method of the invention is useful for identifying a ligand for hydrophobic protein such as a membrane, pump, channel, receptor kinase, G protein-coupled receptor, or transporter protein or membrane, approached the complex for membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying ligand for hydrophobic protein based on affinity selection which can operate in the presence of amphiphile without regard to the specific biological function of hydrophobic target protein -

                                                                                                                                               5
                                                                                                                                                                                                                                                                                                               of the present invention which describes human telomerase reverse transcriptase (hTRT). The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant transcription of the compound;

(C) a modulator of hTRT, by detecting the change in hTRT recombinant transcription of the compound;

(B) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase RNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of the hTRT and the product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing the expression; and (E) the use of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used to treat conditions that are associated with high telomerase.

                                                                                                                                                                           vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graff growth tissues comes, diabetic ulcers and burns and to promote the invention are useful for the sores.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth.
                                                                      Sequence
                                                                                                                  skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity or vascularization. This sequence represents a human VEGF-X protein which can be expressed in E. coli systems and which is described in the method
                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has
                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Fig

                                                                                                                                        The present invention relates to vaccine for prevention and/or prophylaxis of infectious salmon anaemia in fish. The invention provides for nucleic acid sequence encoding viral proteins of infectious salmon anaemia virus (ISAV) as well as the isolated protein. Nucleic acids encoding viral protein is useful for the manufacture of a DNA vaccine for diagnosis, treatment and/or prophylaxis of infectious salmon anaemia in fish, and viral protein can be used for the manufacture of antibodies that are specific for ISAV. The present sequence is infectious salmon anaemia virus 92-M fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 200

                                                                                                                                                                                                                                                                                                                    membrane, integral membrane, transmembrane, monotopic or polytopic membrane, pump, channel, receptor kinase, G protein-coupled receptor, or transporter protein, or membrane-associated enzyme, or Myc tag-EE tag-human m2 mAChR, flag tag-human beta2 adrenergic receptor-EE tag, human neurokinin 3 receptor-HSV tag-Myc tag, flag tag-human m1 mAChR-EE tag, and rat m3 mAChR-HSV tag-OctaHis tag. The ligand identified by the method of the invention is useful for the development of novel medicines and medicinal diagnostics. The present sequence represents the protein sequence of muscarinic acetylcholine receptor in a baculovirus expression vector used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for identifying a ligand for a hydrophobic protein. The method comprises selecting a ligand molecule by affinity selection by exposing a hydrophobic target protein bound by an amphiphile to a multiplicity of molecules to promote formation of at least a complex between the hydrophobic target protein and the ligand molecule, separating the complex from the unbound molecules, and identifying the ligand molecule. The method of the invention is useful for identifying a ligand for hydrophobic protein such as a momentum of integral membrane transmembrane monotonic or nolytonic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transmembrane protein; monotopic membrane protein; polytopic membrane protein; pump; channel; receptor kinase; G protein-coupled receptor; transporter protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABG31502;

                                                                                                                                                                                                                                                                                                                                             cc to express leech active polypeptides. The active polypeptide has
CC a molecular weight of 7000-17,000 Da (as measured by mass
CC a molecular weight of 7000-17,000 Da (as measured by mass
CC Rhynchobdellida, of genus Placobdella and especially of species
CC Rhynchobdellida, of genus Placobdella and especially of species
CC p. papillifera. The polypeptide inhibits the alternate route of
CC complement activation but has substantially no effect on complement
CC complement factor D and/or C3bBb complex. The active polypeptide is
CC useful for manufacturing a medicament and inhibits one or more steps
CC in the alternate pathway of complement activation. It is useful for
CC treating or preventing conditions, such as haemodialysis and
CC cardio-pulmonary bypass, the presence of in-dwelling catheters and
CC extra-arterial stents, rejection of transplanted organs or tissues,
CC autoimmune diseases including lupus arthritis, rheumatoid arthritis,
CC glomerulonephritis, nephritis, nephropathy, sepsis, injury caused to
CC tissues by reperfusion after an ischaemic period and other conditions
CC associated with activation of complement, including anaphylaxis,
CC anemia involving activation of alternate complement pathway in a
CC carfiner
                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                    test sample on UDP-glucose:glycoprotein glucosyltransferase (UGGT) activity. The method comprises exposing an acceptor substrate for UGGT to a labelled donor in the presence of the test sample and UGGT. The method is useful for determining UGGT activity. In particular, the method is useful in glucosyltransferase assay and kinetics measurement for determining UGGT activity. UGGT is a soluble enzyme of the endoplasmic reticulum which catalyses the addition of a glucose residue onto asparagine-linked oligosaccharides, which are present on incorrectly folded glycoproteins. The present sequence is the honeybee melittin signal peptide. This sequence was used in the construction of an expression vector for rat UGGT (see AAF60732 and AAB72436).

The ligand identified by the method of the invention is useful for the development of novel medicines and medicinal diagnostics. The present sequence represents a heterologous signal sequence peptide used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel method for identifying a ligand for a hydrophobic protein. The method comprises selecting a ligand molecule by affinity selection by exposing a hydrophobic target protein bound by an amphiphile to a multiplicity of molecules to promote formation of at least a complex between the hydrophobic target protein and the ligand molecule, separating the complex from the unbound molecules, and identifying the ligand molecule. The method of the invention is useful for identifying a ligand for hydrophobic protein such as a
                                                                                                  Honeybee; melittin; signal sequence; immunoglobulin; B-cell lymphoma; B-cell mediated pathology; cytostatic; immunosuppressive; dermatological; antiinflammatory; neuroprotective; antidiabetic; antithyroid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying ligand for hydrophobic protein based on affinity selection which can operate in the presence of amphiphile without regard to the specific biological function of hydrophobic target protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               G protein-coupled receptor; transporter protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                         र्
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents the honeybee melittin signal sequence, used in CC the invention to maximise secretion of heterologous proteins from insect cells. The invention relates to a novel composition for altering a B-cell mediated pathology in a patient. The composition contains a chimeric protein comprising at least a portion of a variable region of heavy chain cor light chain (VH or VL) linked to at least a portion of an cimmunoglobulin constant region, where VH or VL region is associated with a B cell clone from the patient having the B cell mediated pathology. The composition of the invention has cytostatic, immunosuppressive, dermatological, antiinflammatory, neuroprotective, antidiabetic, and contithyroid activity. The composition is a vaccine useful for altering a cell mediated pathology. This includes B cell lymphoma e.g.

CC non-Hodgkins lymphoma, refractory low grade or follicular B cell cymphoma; autoimmune disease e.g. multiple sclerosis, systemic lupus erythematosus, anti-Hu associated paraneoplastic neurological syndrome, autoimmune hepatitis, Type I diabetes, autoimmune thyroiditis and cell colony stimulating factor (GM-CSF) or chemokine e.g. monocyte chemotactic colony stimulating factor (GM-CSF) or chemokine e.g. monocyte chemotactic colony stimulating factor (GM-CSF) or chemokine e.g. monocyte chemotactic

The method may have CC cytostatic, neuroprotective, antidiabetic, dermatological, antirheumatic, immunosuppressive, antinflammatory, antiarthritic and calitring a T cell mediated pathology in a patient, where the T cell mediated pathology in a patient, where the T cell mediated pathology is T cell lymphoma, or an autoimmune disease selected from multiple sclerosis, systemic lupus erythematosus, diabetes, composition of the invention arthritis, and thyroiditis. The present sequence represents the honeybee melittin secretory signal sequence, this sequence was used as a leader sequence in to maximise the secretion of heterologous proteins from transfected control control that the sequence control control transfected in to maximise the secretion of heterologous proteins from transfected control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                     The present invention relates to an expression cassette for executing or promoting the expression of a structural gene. The expression cassette comprises a promoter connected to said structural gene and a secretion signal peptide which is arranged upstream of the structural gene. The present sequence is a signal peptide, which was used in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                            A nucleic acid for promoting the expression of genes, comprises a secretion signal from chicken lysozyme or SF162 type human immunodefficiency syndrome virus -

Biochim. Biophys. Acta 1031:143-161(1990).
-!- FUNCTION: Main toxin of bee venom with strong hemolytic activity.
Integrates into cell membranes and has multiple effects, probably,
as a result of its interaction with negatively charged
phospholipids. It inhibits well known transport pumps such as the
Na(+)-K(+)-ATPase and the H(+)-K(+)-ATPase. Increases the
permeability of cell membranes to ions, particularly Na+ and
indirectly Ca(2+), because of the Na(+)-Ca(2+)-exchange.
-!- SUBUNIT: Momomer and homotetramer.
-!- SUBCELLULAR LOCATION: Secreted.

Integrates into cell membranes and has multiple effects, probably, as a result of its interaction with negatively charged phospholipids. It inhibits well known transport pumps such as the Na(+)-K(+)-ATPase and the H(+)-K(+)-ATPase. Increases the permeability of cell membranes to ions, particularly Na+ and indirectly Ca(2+), because of the Na(+)-Ca(2+)-exchange (By similarity).

SUBUNIT: Momomer and homotetramer (By similarity).

SUBCELLULAR LOCATION: Secreted (By similarity).

TISSUE SPECIFICITY: Expressed by the venom gland.

SIMILARITY: BELONGS TO THE MELLITIN FAMILY.

"Cloning and sequencing of cDNA coding for prepromelittin of Polistes hebraeus, Vespa magnifica and Vespula maculifrons.";
Submitted (FEB-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Main toxin of bee venom with strong hemolytic activity.
Integrates into cell membranes and has multiple effects, probably, as a result of its interaction with negatively charged phospholipids. It inhibits well known transport pumps such as the Na(+)-K(+)-ATPase and the H(+)-K(+)-ATPase. Increases the permeability of cell membranes to ions, particularly Na+ and indirectly Ca(2+), because of the Na(+)-Ca(2+)-exchange (By

IT "Cloning and sequencing of cDNA coding for prepromelittin of Polistes

IT "Hebraeus, Vespa magnifica and Vespula maculifrons.";

IL Submitted (FEB-2002) to the EMBL/GenBank/DDBJ databases.

IL Submitted (FEB-2002) to the EMBL/GenBank/DDBJ databases.

IT "FUNCTION: Has strong hemolytic activity. Integrates into cell

membranes and has multiple effects, probably, as a result of its

interaction with negatively charged phospholipids. It inhibits

well known transport pumps such as the Na(+)-K(+)-ATPase and the

H(+)-K(+)-ATPase. Increases the permeability of cell membranes to

inns, particularly Na+ and indirectly Ca(2+), because of the

Na(+)-Ca(2+)-exchange (By similarity).

SUBCELLULAR LOCATION: Secreted (By similarity).

ITISUE SPECIFICITY: Expressed by the venom gland.

ITISUE SPECIFICITY: Expressed by the venom gland.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-FEB-2003

RA Schmid G., Englbrecht A., Schmid D.;
RT "Cloning and nucleotide sequence of a cyclodextrin glycosyltransferase gene from the alkalophilic Bacillus 1-1.";
RL (In) Huber O., Szejtli J. (eds.);
RL Proceedings of the fourth international symposium on cyclodextrins, pp.71-76, Kluwer Academic Publishers, Dordrecht and Boston (1988).
CC -1- CATALYTIC ACTIVITY: Degrades starch to cyclodextrins by formation of a 1,4-alpha-D-glucosidic bond.
CC -1- COFACTOR: BINDS TWO CALCIUM IONS.
CC -1- SUBUNIT: Monomer.
CC -1- MISCELLANFOVY ---
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 14
